

I'm learning to make AI agents work for me.

Not as a tool. As a team.

A project manager's path to spec-driven, agentic delivery.
Documents attached — the real work, start to finish.

“I use AI” is table stakes now.

Orchestrating AI agents through a real delivery process — clear roles, clean handoffs, an audit trail you could hand to a regulator — is something else entirely.

One is a party trick.
The other is a discipline.

The landscape

Spec-Driven Development

The spec is the source of truth. The code serves the spec, not the other way around.

Greenfield vs. brownfield

Building new is the easy demo. Safely changing what already exists is the real skill.

Three tools I'm going deep on

GitHub Spec Kit · OpenSpec · BMAD.

The constitution

The project's non-negotiable rules the AI must follow before it writes a single line of code.

- Every change is logged and can't be erased.
- Tests come first.
- Use the simplest thing that works.

Governance baked in. Not bolted on.

The spec & the plan

The spec

The plain what & why. Any stakeholder can read it and approve it.

The plan

The how. The approach an AI agent actually builds from.

Together they make the AI build to my intent — instead of guessing.

Governance & traceability.

Anyone can get an agent to produce something. Far fewer can prove it was built to spec, reviewed at the right gate, and traceable from requirement to test.

That's what earns trust in fintech, supply chain, and defense.

I'm sharing every step.
